-0 **Pierce County Public Works & Utilities Road Operations Division** HEINE SE I WORKS AND **Road Operations Road Maintenance Asset Management**

About Us

- 1,790 square miles •Including Mt. Rainier National Park
- County Population
 •813,600 total; 382,115 unincorporated
- 3,150 lane miles (unincorporated)
- 164 full time employees
 - 15 seasonal-hires (normally)
- 170+ pieces of equipment
- Three Road Ops facilities

Road Asset Management

Is a holistic approach to managing road assets under total life-cycle strategy. Asset management strategies are not task oriented, but instead are driven by preestablished priorities and level of service goals for each asset category and subcategory. Consequently, performance measures are determined by assessments of outcomes in terms of asset condition; asset function; safety; and costs to achieve levels of service over time. Statistical information is compiled and evaluated relating to types of assets, usage, condition level, threshold of intervention, quantifiable risks, future construction, MOP costs, and long term outcomes.

Why Asset Management?

Public Expectations

Do your job, and do it better. Do more with fewer resources. Cut costs Reduce spending

Government assumed inefficient until proven otherwise?

I don't remember drinking any Kool-Aid when I was hired...

Pierce County Road Operations Division Mission Statement:

To maintain, operate and preserve Pierce County's roads at full function, 24/7, as safely and efficiently as possible.

8 Elements of PWU Road Ops AM System

- 1.<u>Inventory</u>
- 2.Level of Service (LOS)
- 3. Condition Assessment
- 4.<u>Usage Data</u>
- 5.<u>Cost Data</u>
- 6.<u>Replacement Model</u>
- 7. Risk Assessment
- 8.<u>Performance Measures</u>

Inventory

An accurate inventory for each asset type and category is compiled and maintained. The level of attribute detail captured for each asset is driven by several factors:

Provides the ability to define and assess relevant asset condition information.
 Provides the ability to evaluate and establish optimal LOS goals for the asset.
 Provides the ability to determine the appropriate M&O activity when condition thresholds are exceeded.

4. Provides the ability to track performance of the asset relevant to its expected lifecycle.

5. Provides the ability to identify the value of each asset and the sum of assets within each category.

6. Provides the ability to capture and correlate MOP costs specific to each asset.

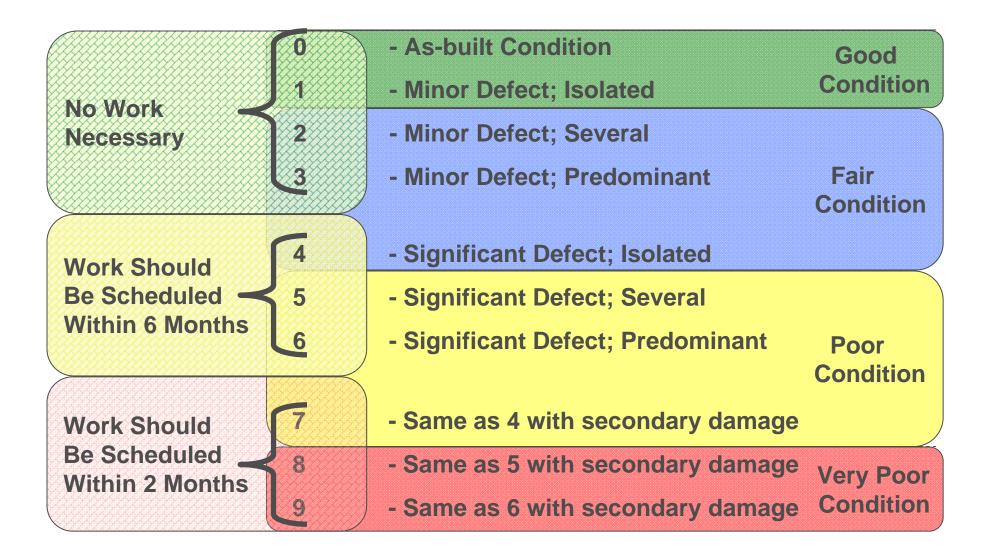

Level of Service (LOS)

Establishes the desired asset condition thresholds (severity and extent of defects that will be tolerated before corrective action is taken), and/or scope service that will be delivered (bare and wet pavements during snow events, potholes patched within 24hrs of notice, etc.). The LOS goal serves as an agreement with citizens and policymakers on the services to be provided including a comprehensive understanding of the costs to deliver that service.

Condition Assessment

A systematic assessment of the condition of an asset relative to its function and to the factors germane to its MOP needs. Asset condition is captured and weighted by defect type, defect severity, and the extent of the defect as it affects each asset. The condition assessment provides managers the ability to determine whether or not LOS goals are being met, the optimal remedy if action is warranted, and overall performance of the asset within its lifecycle model.

Condition Assessment

Usage Data

Asset usage data is important to the development of MOP program performance modeling. The level of asset usage often correlates directly to the rate at which an asset deteriorates over time. Usage information is also utilized when prioritizing competing needs, particularly when managing resource constraints, e.g. – resources can be invested to benefit the largest number of citizens.

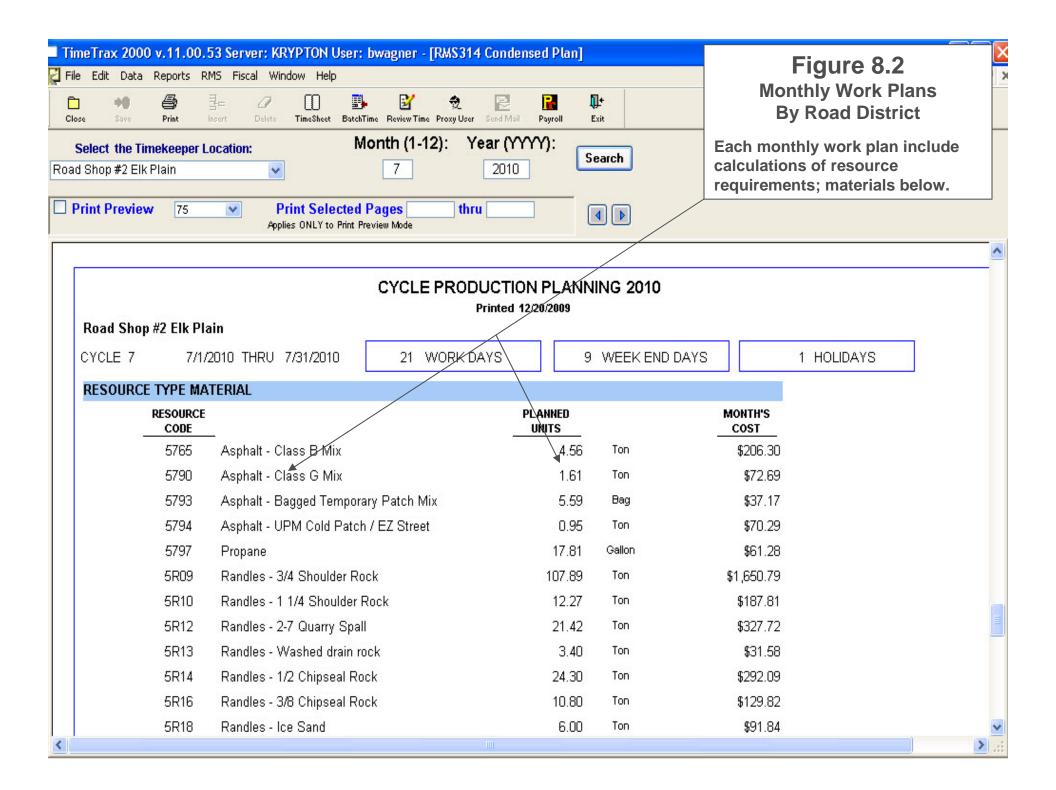

Resource Requirements and Cost Data

Cost data includes all costs associated with the MOP activities required for each asset category. Cost data is evaluated at a level of detail that provides managers the ability to quantify both budget requirements and the corresponding labor, equipment and material resources needed to meet objectives.

Replacement Model

A replacement model is used to determine the optimal time, scope of action and method to replace an asset consistent with its lowest lifecycle model. Typically displayed over a deterioration curve, the replacement model considers the optimal balance of repair and maintenance typically required over time until replacement or reconstruction of the asset is required to avoid reaching a point of diminished return on investment. This model also serves to evaluate various MOP strategies and the associated costs of each.

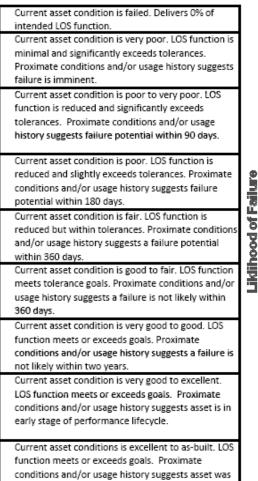

Typical Pavement Life Curve

Risk Assessment

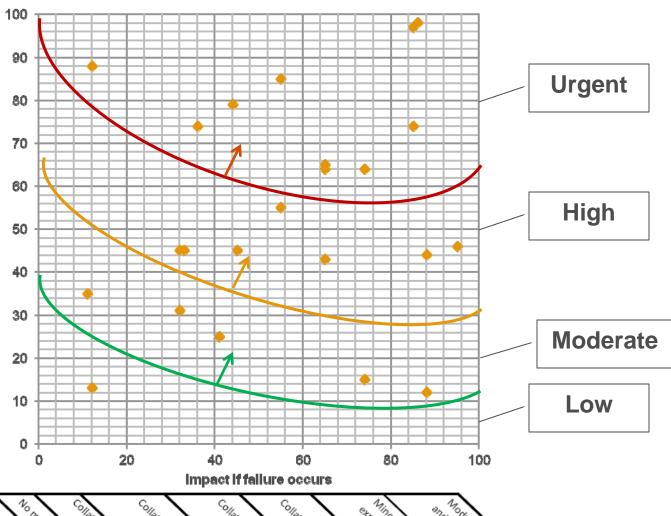

The Risk Assessment process is an estimate of two important categories of risk factors. The likelihood an asset will fail and/or may reach a condition that creates an undesirable outcome; and, the scope of impact should such a failure occur. The weighting factors for each include relevant asset attributes, environmental factors, potential impacts to public safety, exposure to liability and/or the potential that collateral damage may occur. This information is used in conjunction with condition assessment and LOS information to triage competing needs and to prioritize, plan and schedule work.

recently constructed.

Performance Measures

A series of key performance indicators expressed in qualitative, quantitative, or other tangible terms that indicate whether current performance of an asset, and the corresponding MOP program(s), are meeting objectives and are cost effective.

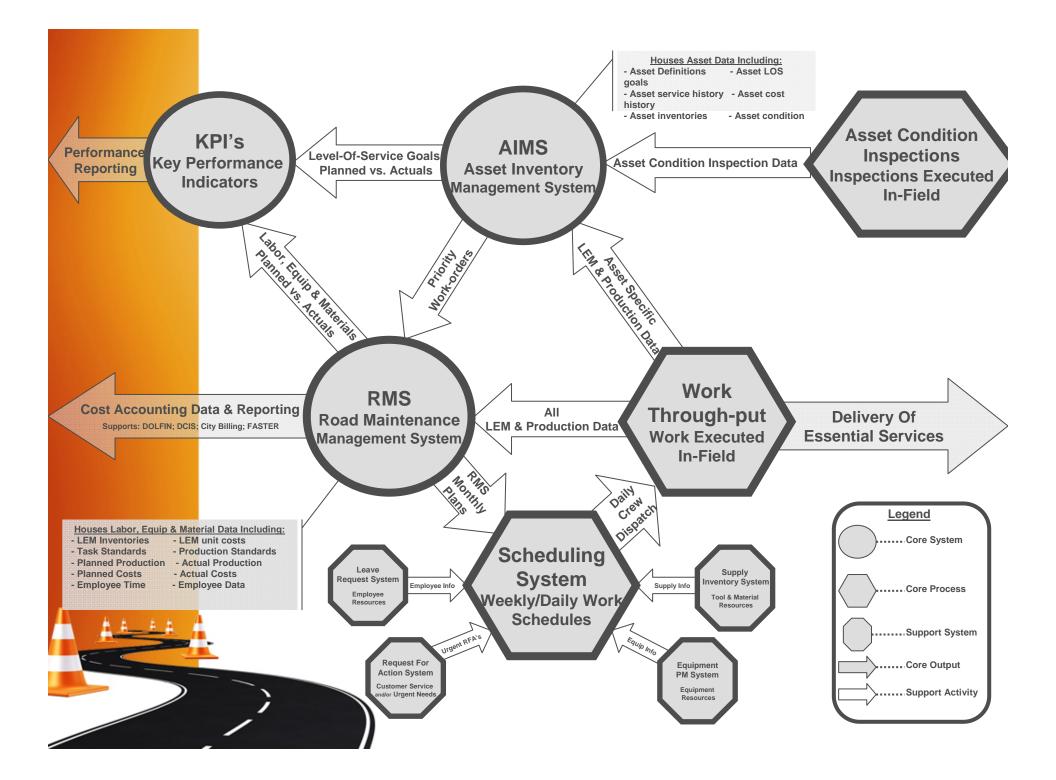

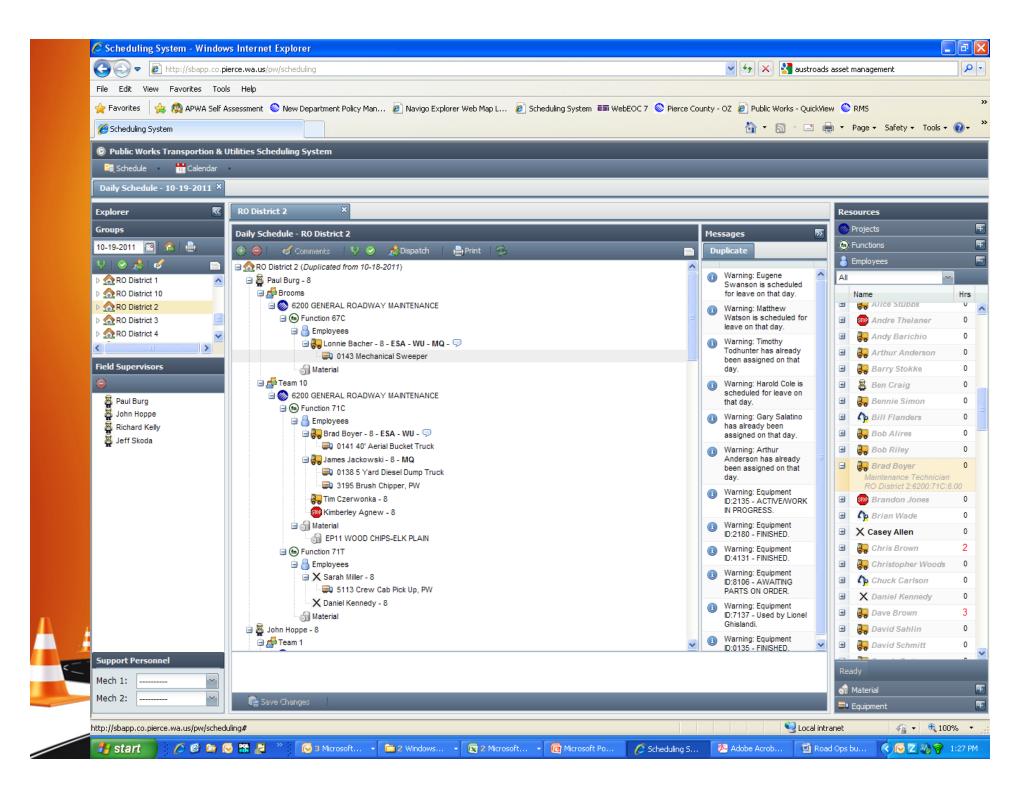

PCI	Arterials	Collectors	Local Access	
100-86	315.79	168.81	601.38	Excellent
